

# ISO Geodetic Registry

<i>Item class</i>	OperationMethod
<i>Name</i>	<b>Coordinate Frame Transformation (geographic 2D domain)</b>
<i>Item status</i>	VALID
<i>Identifier</i>	79
<i>Alias</i>	7-Parameter Transformation
<i>Alias</i>	Geocentric Transformation
<i>Alias</i>	Bursa-Wolf Transformation
<i>Alias</i>	Coordinate Transformation
<i>Alias</i>	Geographic Transformation
<i>Alias</i>	Helmert Transformation
<i>Data source</i>	ISO Geodetic Registry
<i>Remarks</i>	This method is similar to the Coordinate Frame Transformation in the geographic 3D domain but in the geographic 2D domain. This method uses counter-clockwise rotations and is similar to the Position Vector Transformation that uses clockwise rotations. The Position Vector (clockwise) convention is used by the International Earth Rotation and Reference Systems Service (IERS) and International GNSS Service (IGS). See the geocentric Cartesian and geographic 3D variants of this method for transformations of other CRS types.
