ISO Geodetic Registry

Item class OperationMethod

Name Geographic3D to Gravity Related Height

(KNGeoid18)

Item statusVALIDIdentifier1003

Data source ISO Geodetic Registry

Remarks A vertical transformation model between KGD2002 ellipsoid height and

KVD1964 normal orthometric height. This transformation model uses the updated hybrid geoid model KNGeoid18 with a higher precision and wider coverage of the territory of the Republic of Korea than KNGeoid14. This model provides separation values on a regular grid of latitude and longitude intersection points. Replaces KNGeoid14.
