Remarks Replaced by KGD2002

Anchor definition Korean 1985 Datum is the first Korean Triangulation Network based

on the Bessel 1841 ellipsoid. Approximately 7,000 points had been observed with EDM and TRANSIT since 1975, and adjusted through two campaigns by NGII. The origin of the datum was observed and determined by astronomical surveying over 4 years (1981 - 1985).

Remarks The Bessel ellipsoid was derived in 1841 by Friedrich Wilhelm Bessel,

based on several meridian arcs and other data of continental geodetic networks of Europe, Russia and the British Survey of India. It is based on 10 meridional arcs and 38 precise measurements of astrogeodetic latitude and longitude. The dimensions of the ellipsoid axes were defined by logarithms in keeping with former calculation methods. The original axes were defined as a=3272077.14 and b=3261139.33 toise. This was based a weighted mean of values from several authors but did not account for differences in the length of the various toise. The

"Bessel toise" is therefore of uncertain length.

Semi-major axis 6377397.155 m Inverse flattening 299.1528128 m
